outcome will change
probability by very
much

more formally...

- database D a set of rows, one per person
- sanitizing algorithm M probabilistically maps D to event or object in outcome space

differential privacy

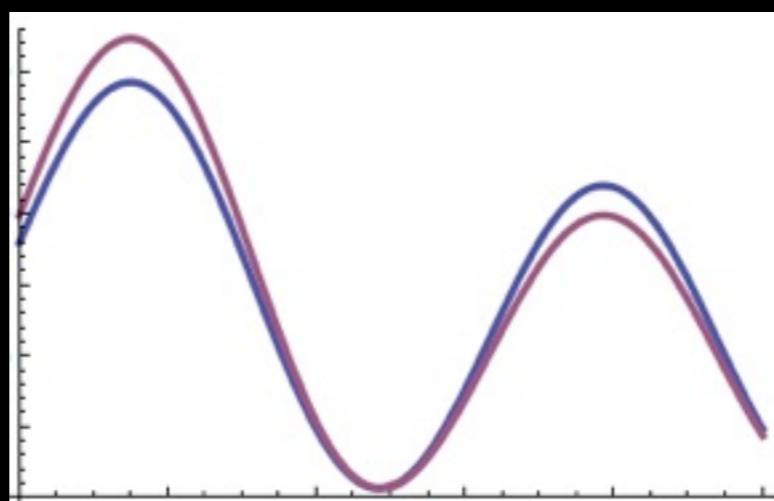

[DinurNissim03, DworkNissimMcSherrySmith06]

ϵ -Differential Privacy for mechanism M :

for any two neighboring data sets D_1, D_2 ,

any $C \in \text{range}(M)$,

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C]$$

differential privacy

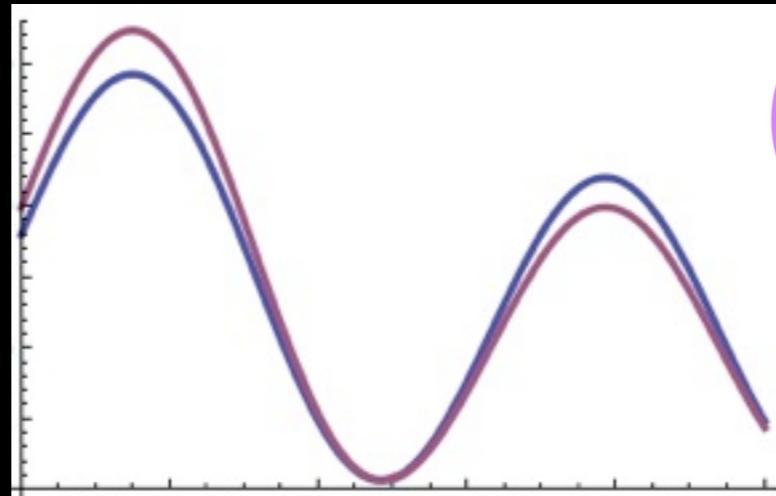

[DinurNissim03, DworkNissimMcSherrySmith06]

ϵ -Differential Privacy for mechanism M :

for any two neighboring data sets D_1, D_2 ,

any $C \in \text{range}(M)$,

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C]$$

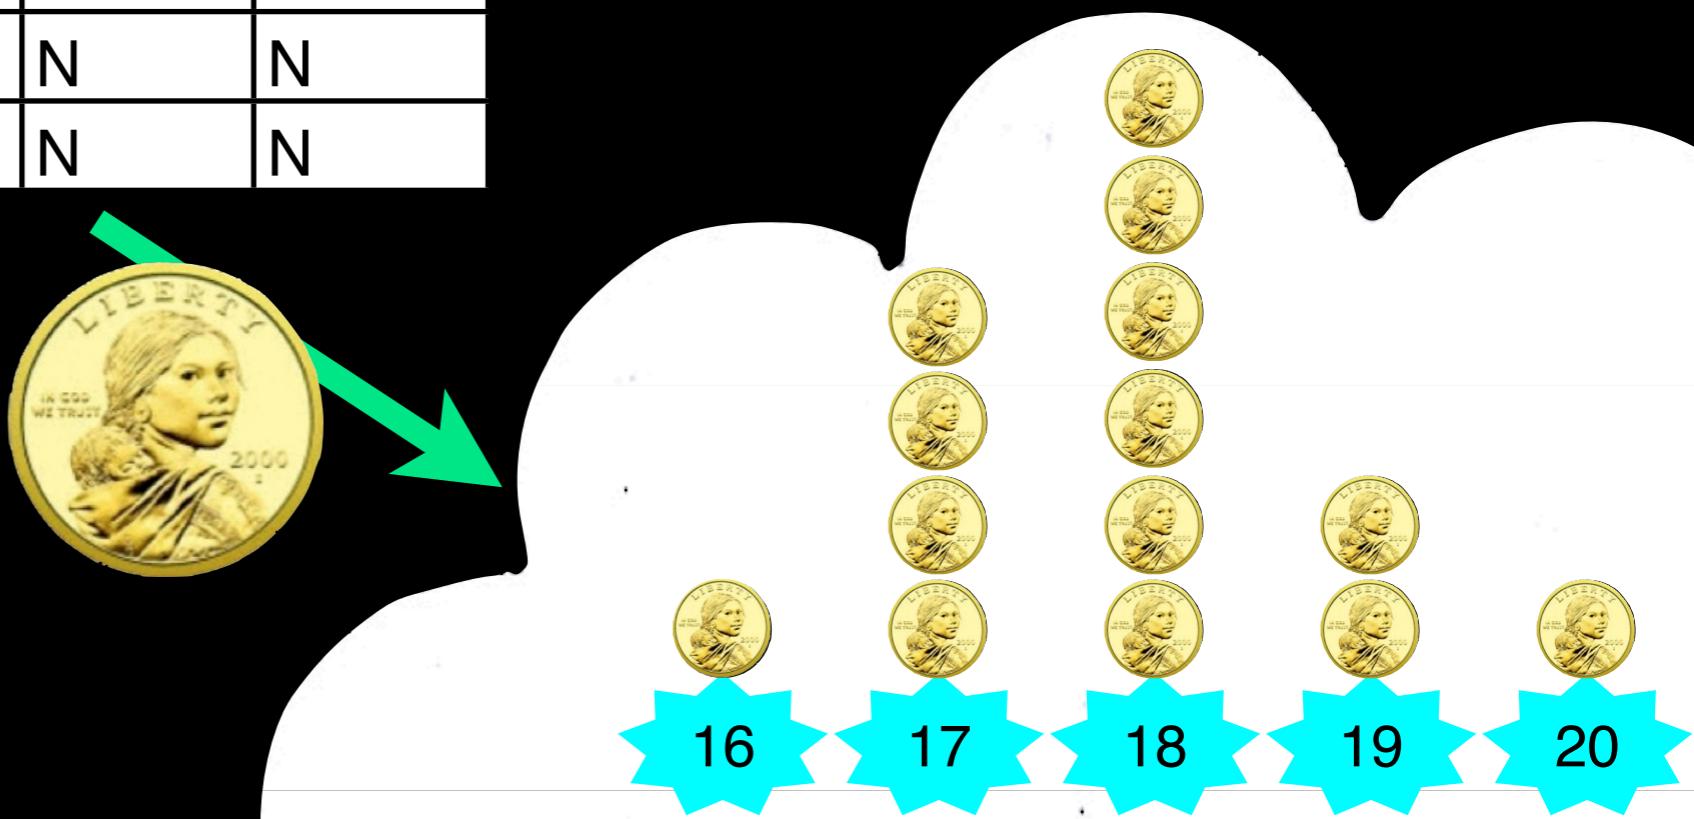

$$e^\epsilon \sim (1 + \epsilon)$$

differential privacy

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C]$$

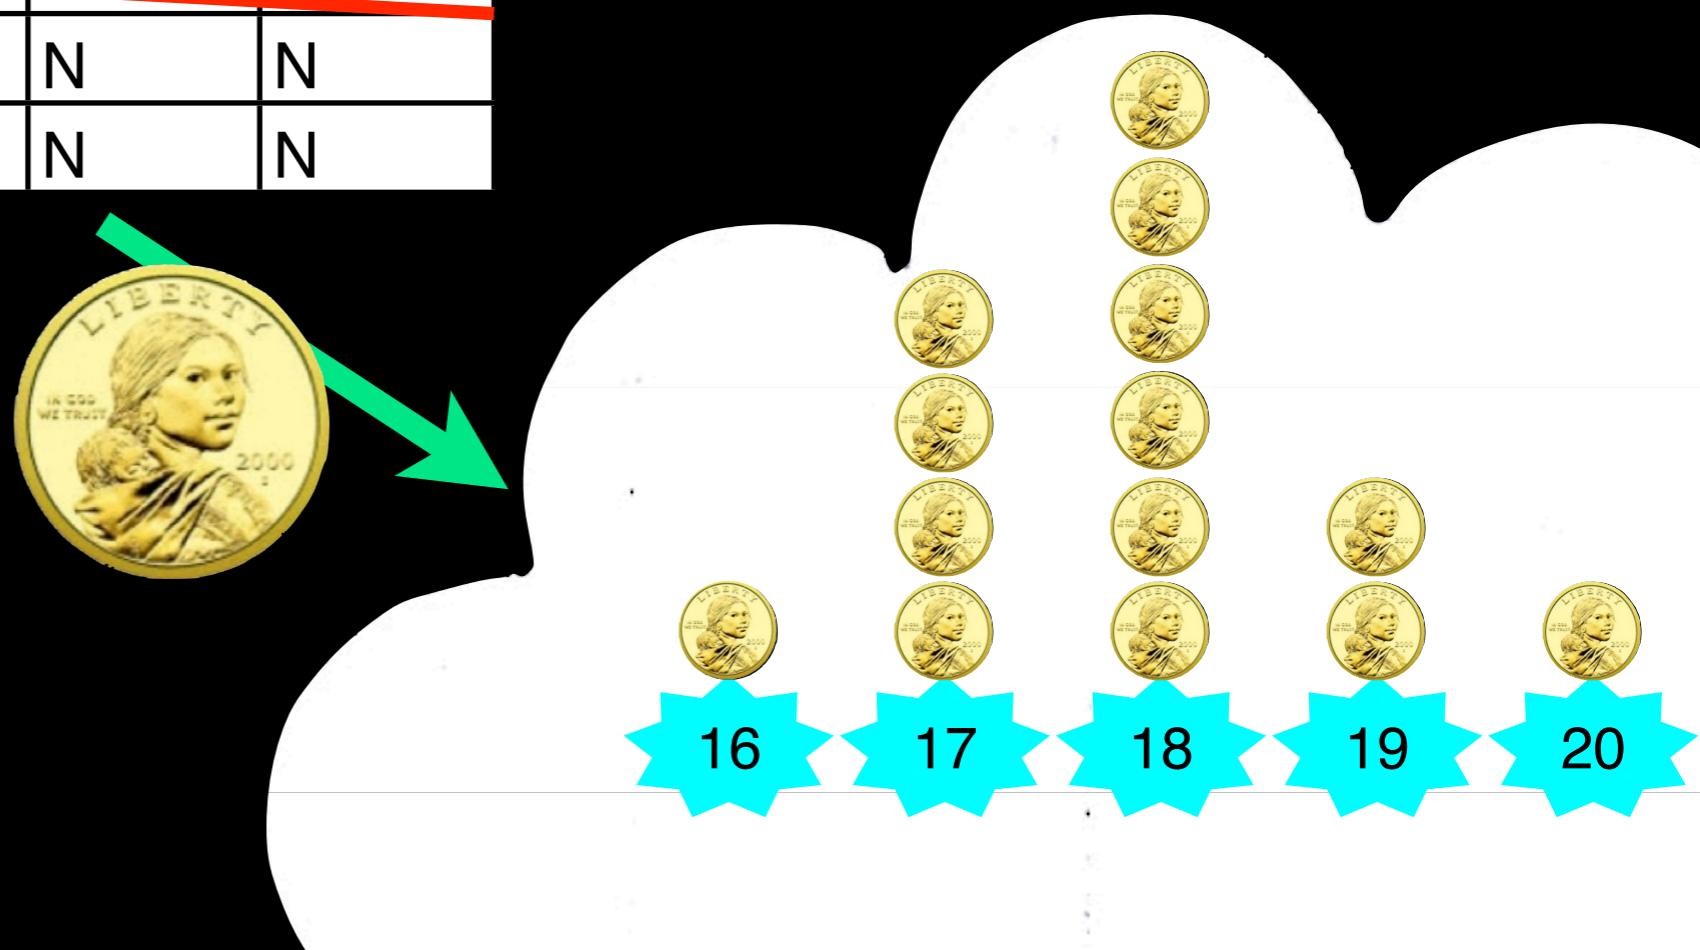

name	DOB	sex	weight	smoker	lung cancer
John Doe	12/1/51	M	185	Y	N
Jane Smith	3/3/46	F	140	N	N
Ellen Jones	4/24/59	F	160	Y	Y
Jennifer Kim	3/1/70	F	135	N	N
Rachel Waters	9/5/43	F	140	N	N

differential privacy

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C]$$

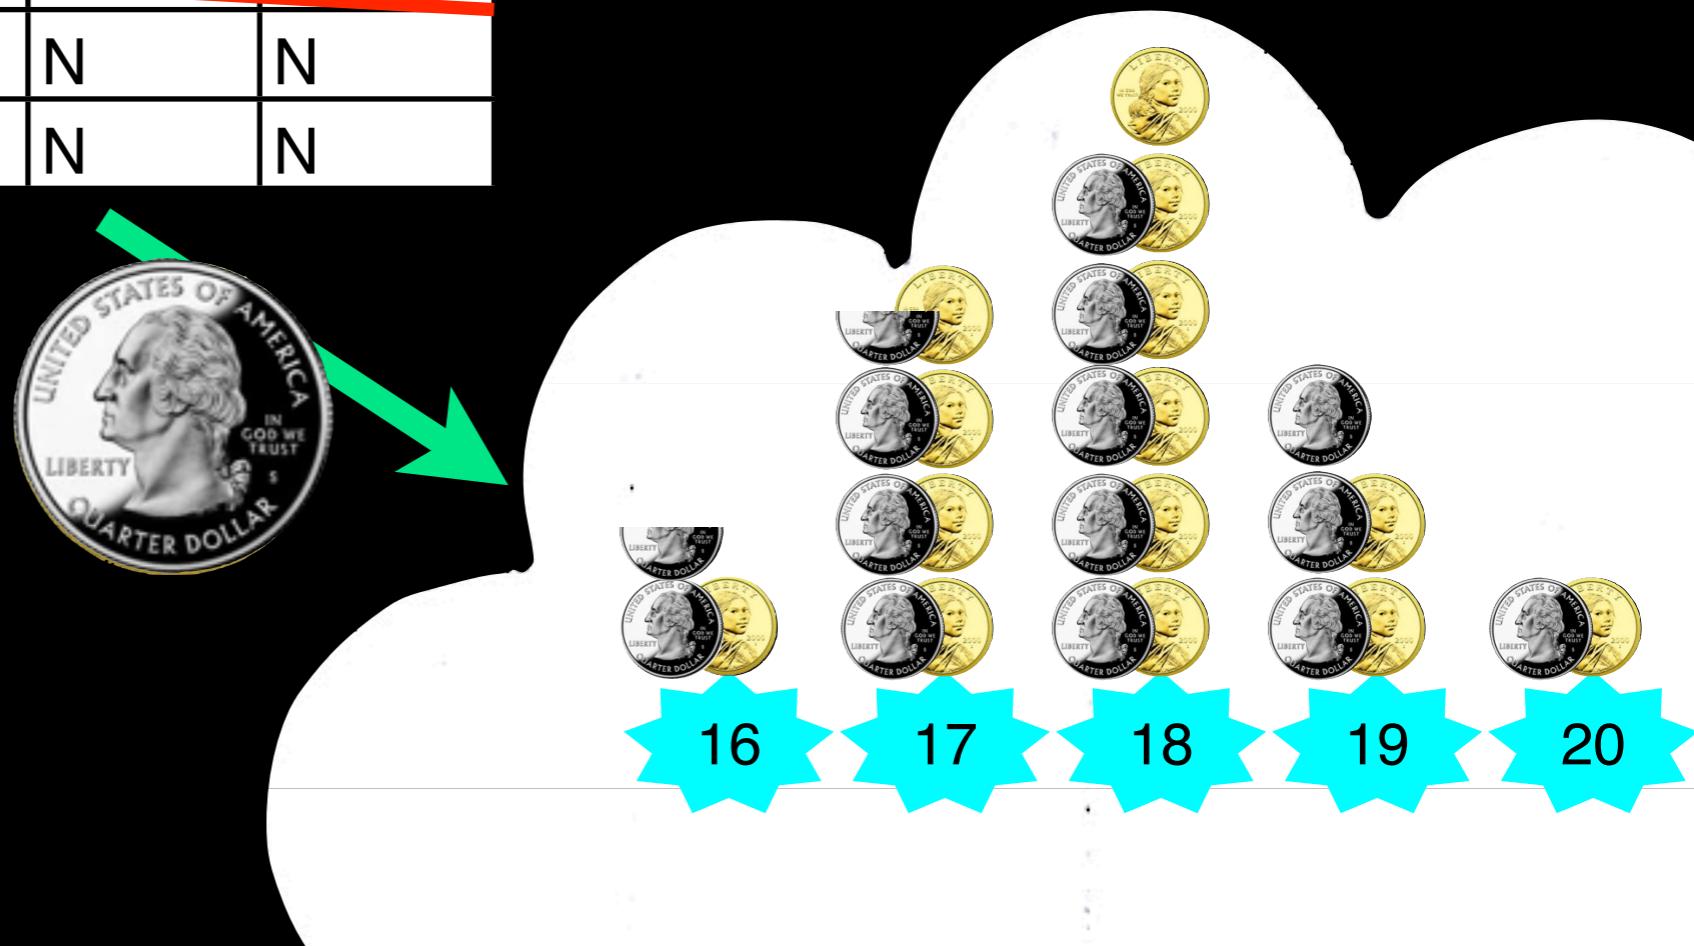

name	DOB	sex	weight	smoker	lung cancer
John Doe	12/1/51	M	185	Y	N
Jane Smith	3/3/46	F	140	N	N
Ellen Jones	4/24/59	F	160	Y	Y
Jennifer Kim	3/1/70	F	135	N	N
Rachel Waters	9/5/43	F	140	N	N

differential privacy

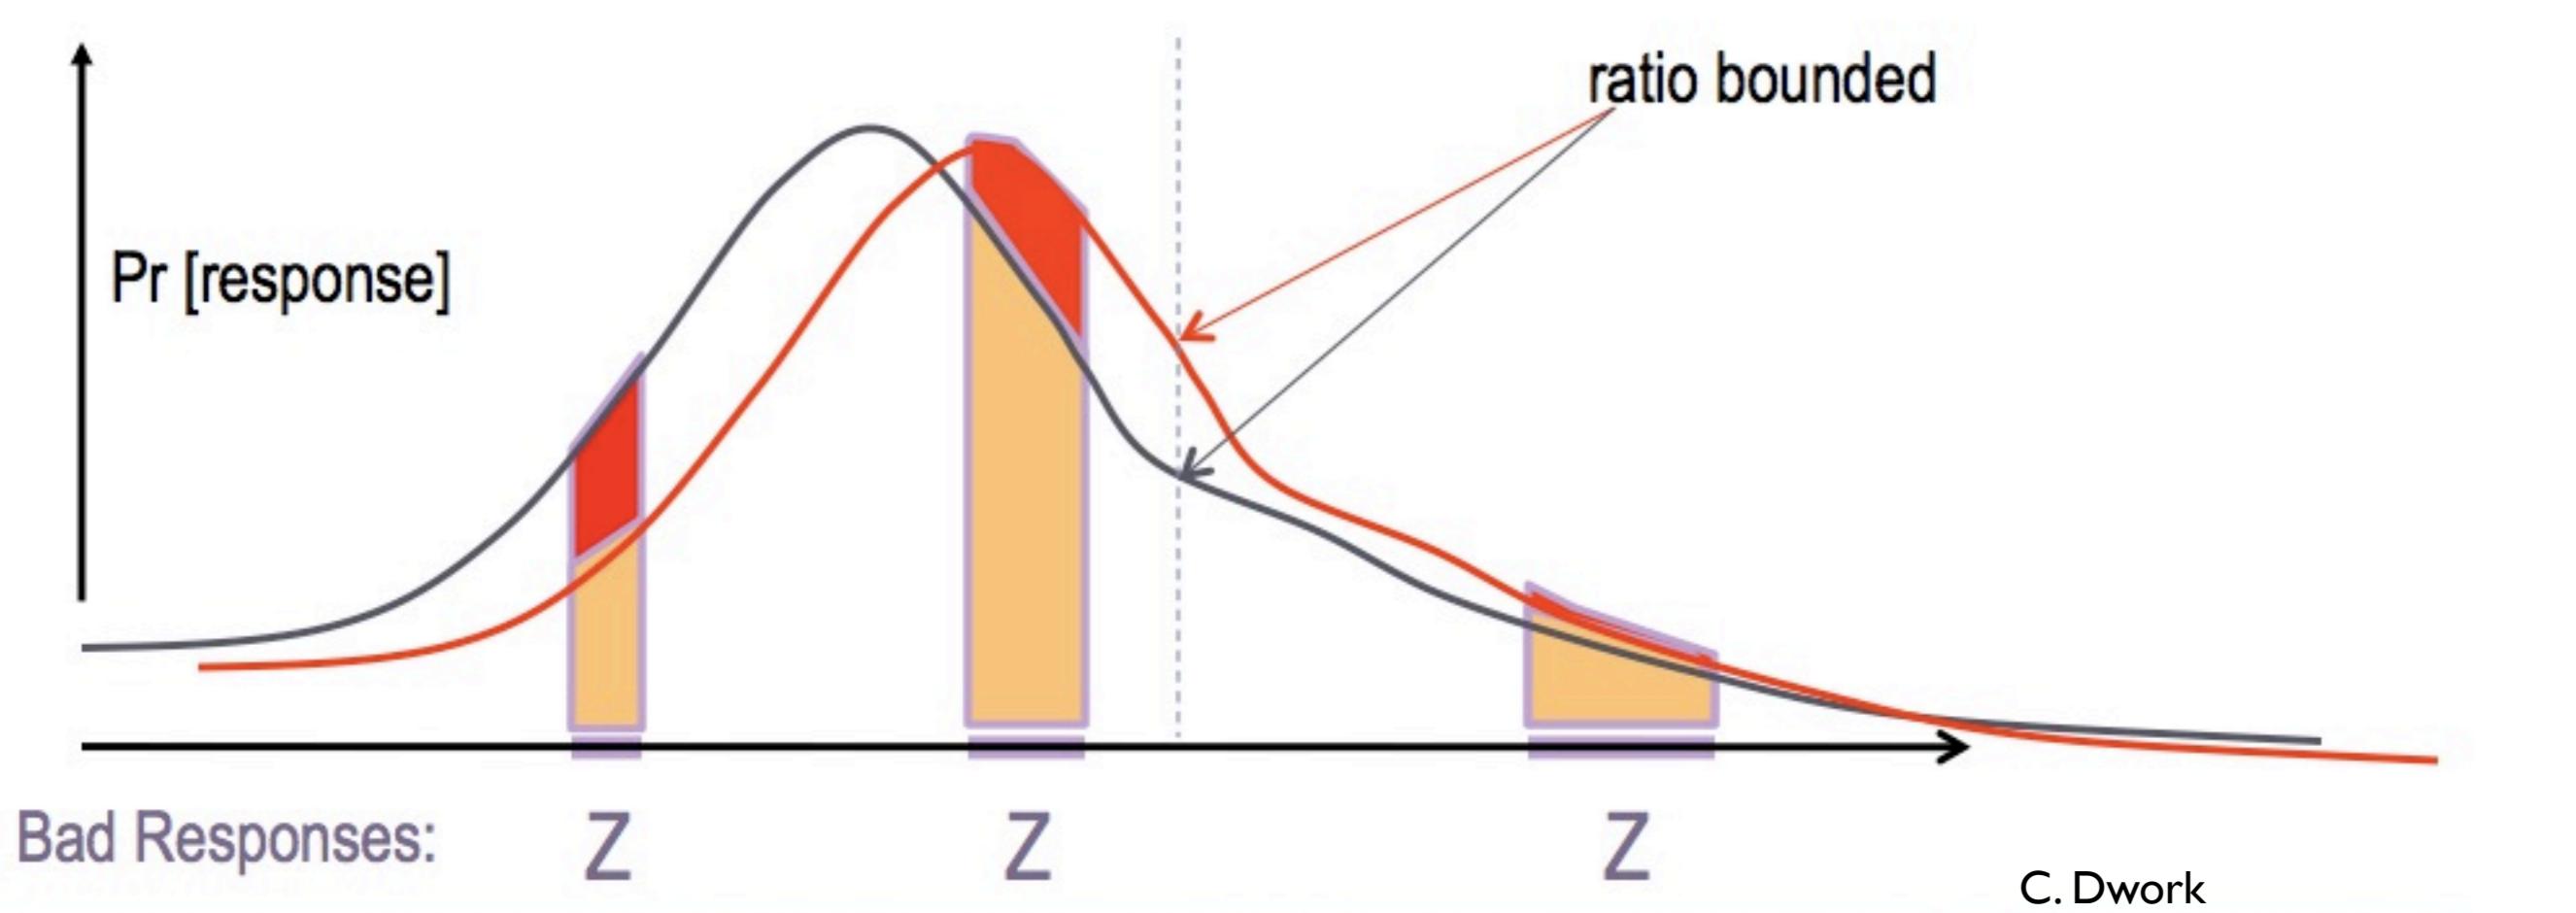

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C]$$

name	DOB	sex	weight	smoker	lung cancer
John Doe	12/1/51	M	185	Y	N
Jane Smith	3/3/46	F	140	N	N
Ellen Jones	4/24/59	F	160	Y	Y
Jennifer Kim	3/1/70	F	135	N	N
Rachel Waters	9/5/43	F	140	N	N

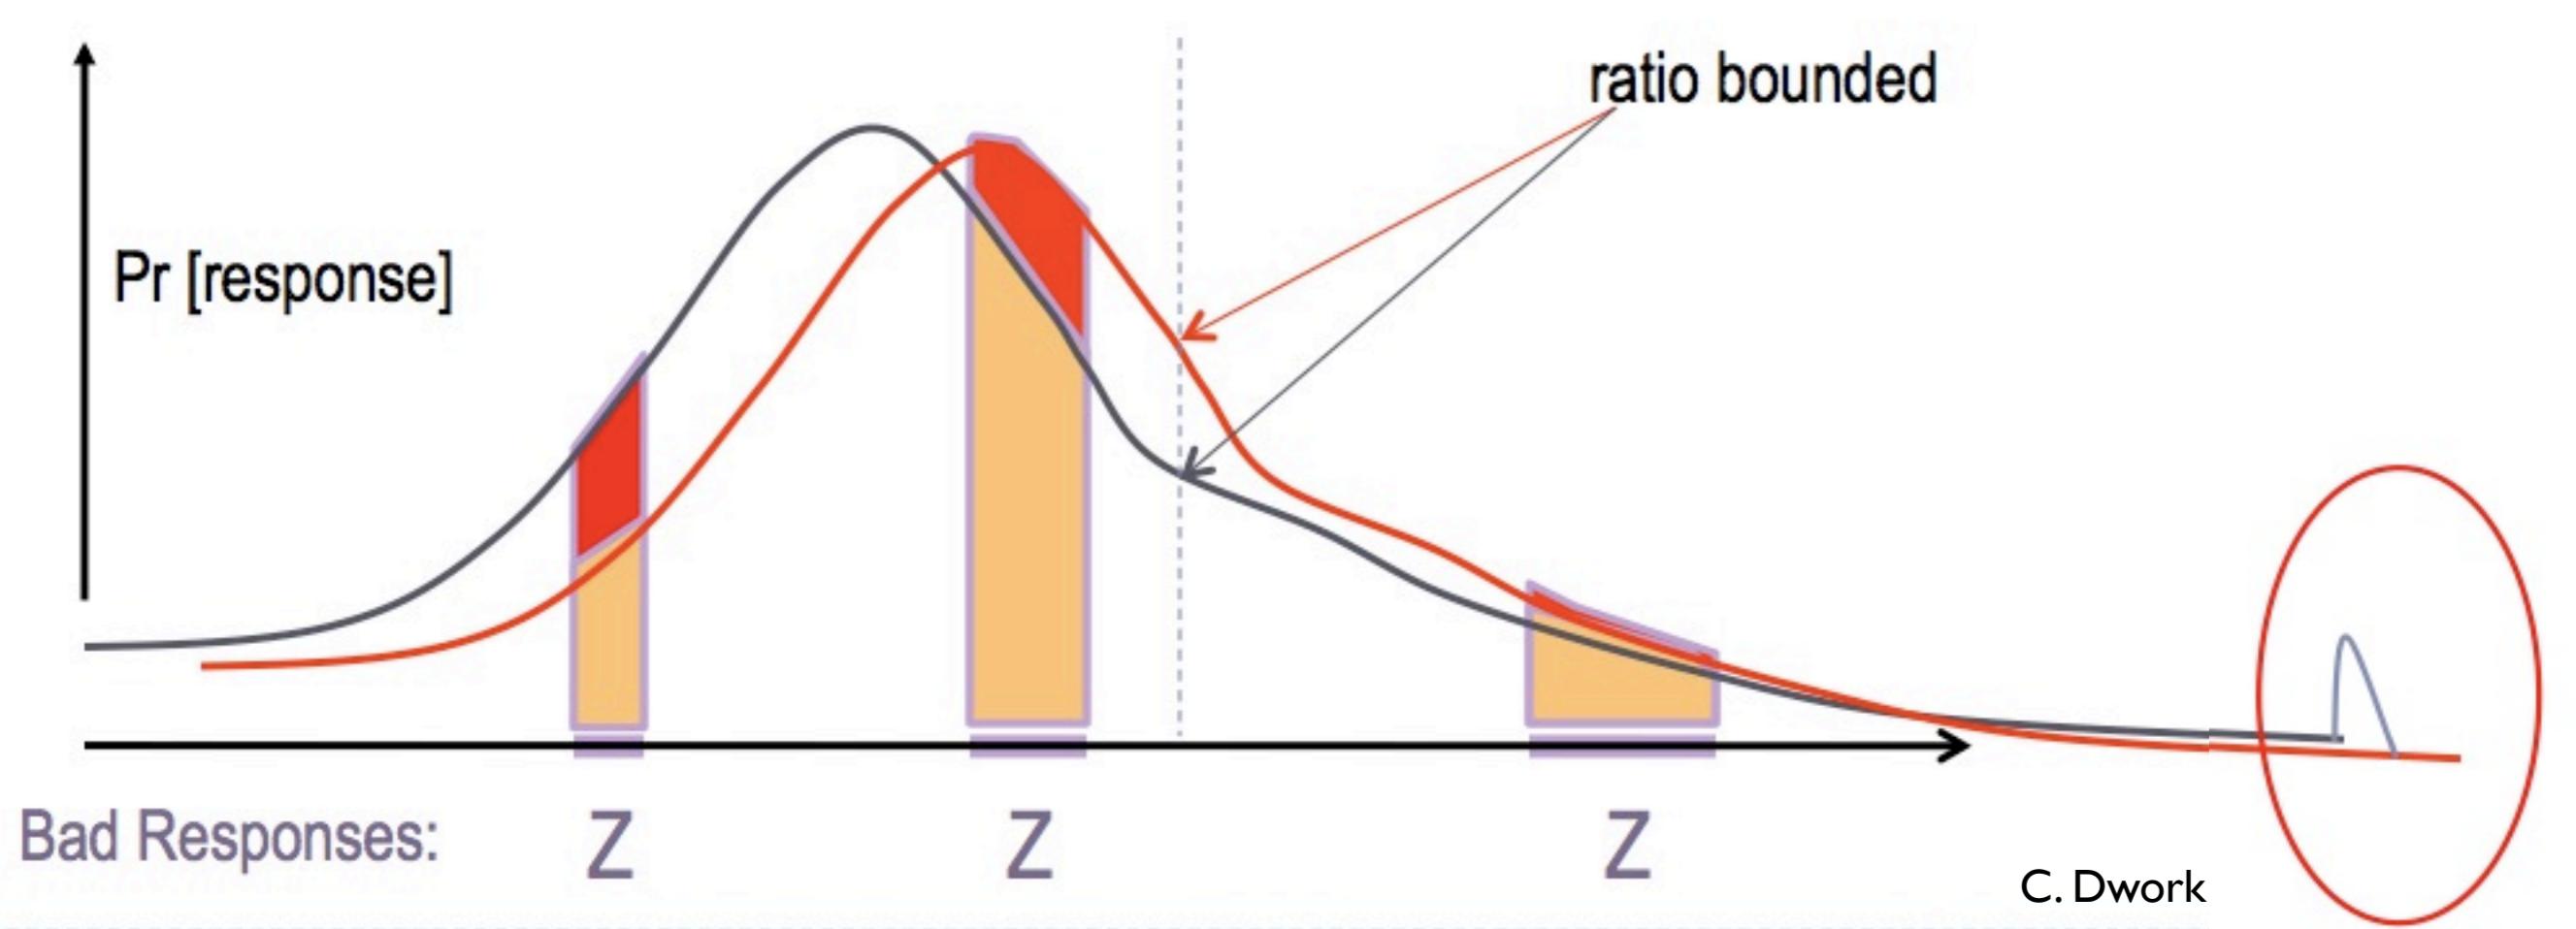

differential privacy

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C]$$

(ϵ, δ) -differential privacy

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C] + \delta$$

differential privacy

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C]$$

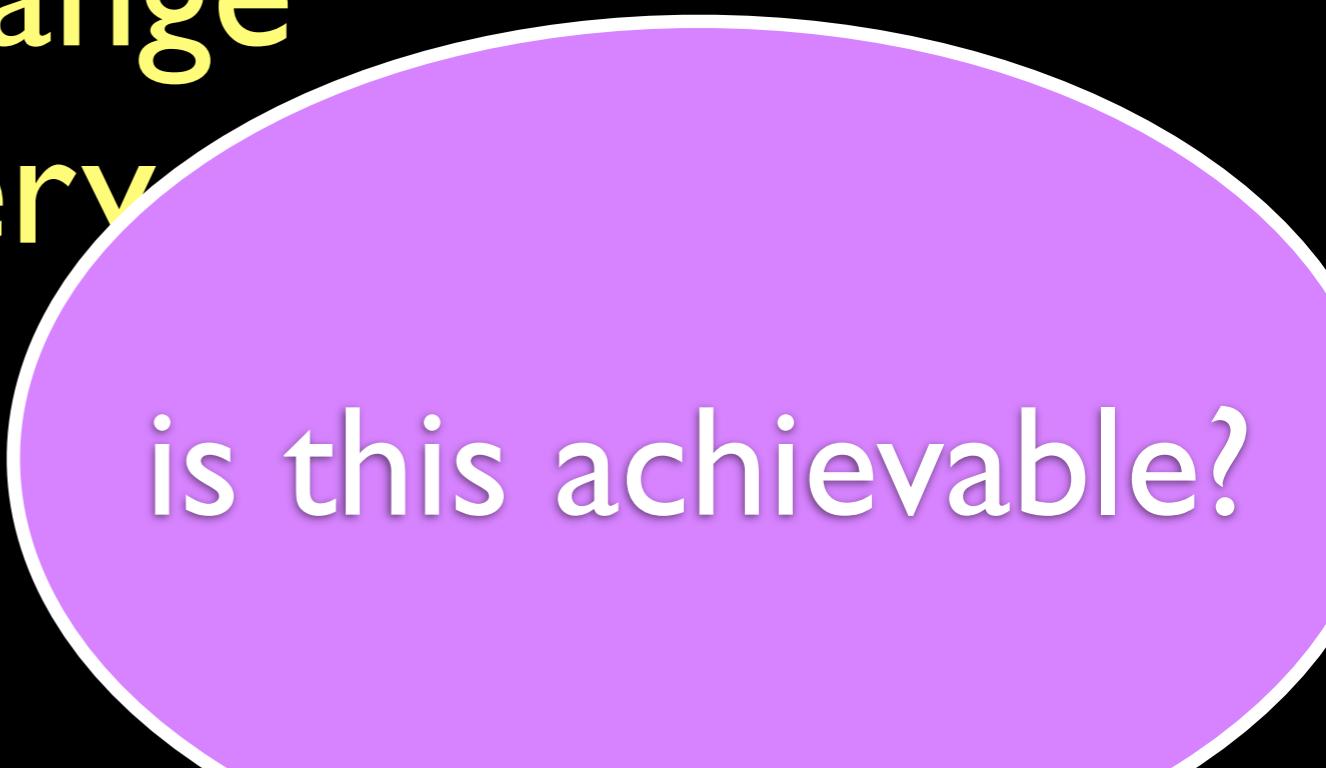

Is a statistical property of **mechanism** behavior

- unaffected by auxiliary information
- independent of adversary's computational power

differential privacy

$$\Pr[M(D_1) \in C] \leq e^\epsilon \Pr[M(D_2) \in C]$$

promise: if you leave
the database, no
outcome will change
probability by very
much

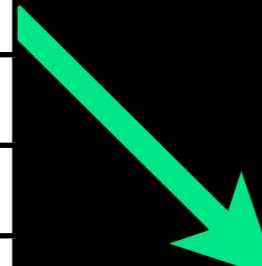

is this achievable?

yes!

if your output is a number...

name	DOB	sex	weight	smoker	lung cancer
John Doe	12/1/51	M	185	Y	N
Jane Smith	3/3/46	F	140	N	N
Ellen Jones	4/24/59	F	160	Y	Y

add noise with
particular shape

18%

public

sensitivity of a function f

$$\Delta f = \max_{D_1, D_2} |f(D_1) - f(D_2)|$$

for neighboring data sets D_1, D_2

sensitivity of a function f

$$\Delta f = \max_{D_1, D_2} |f(D_1) - f(D_2)|$$

for neighboring data sets D_1, D_2

- measures how much one person can affect output

sensitivity of a function f

$$\Delta f = \max_{D_1, D_2} |f(D_1) - f(D_2)|$$

for neighboring data sets D_1, D_2

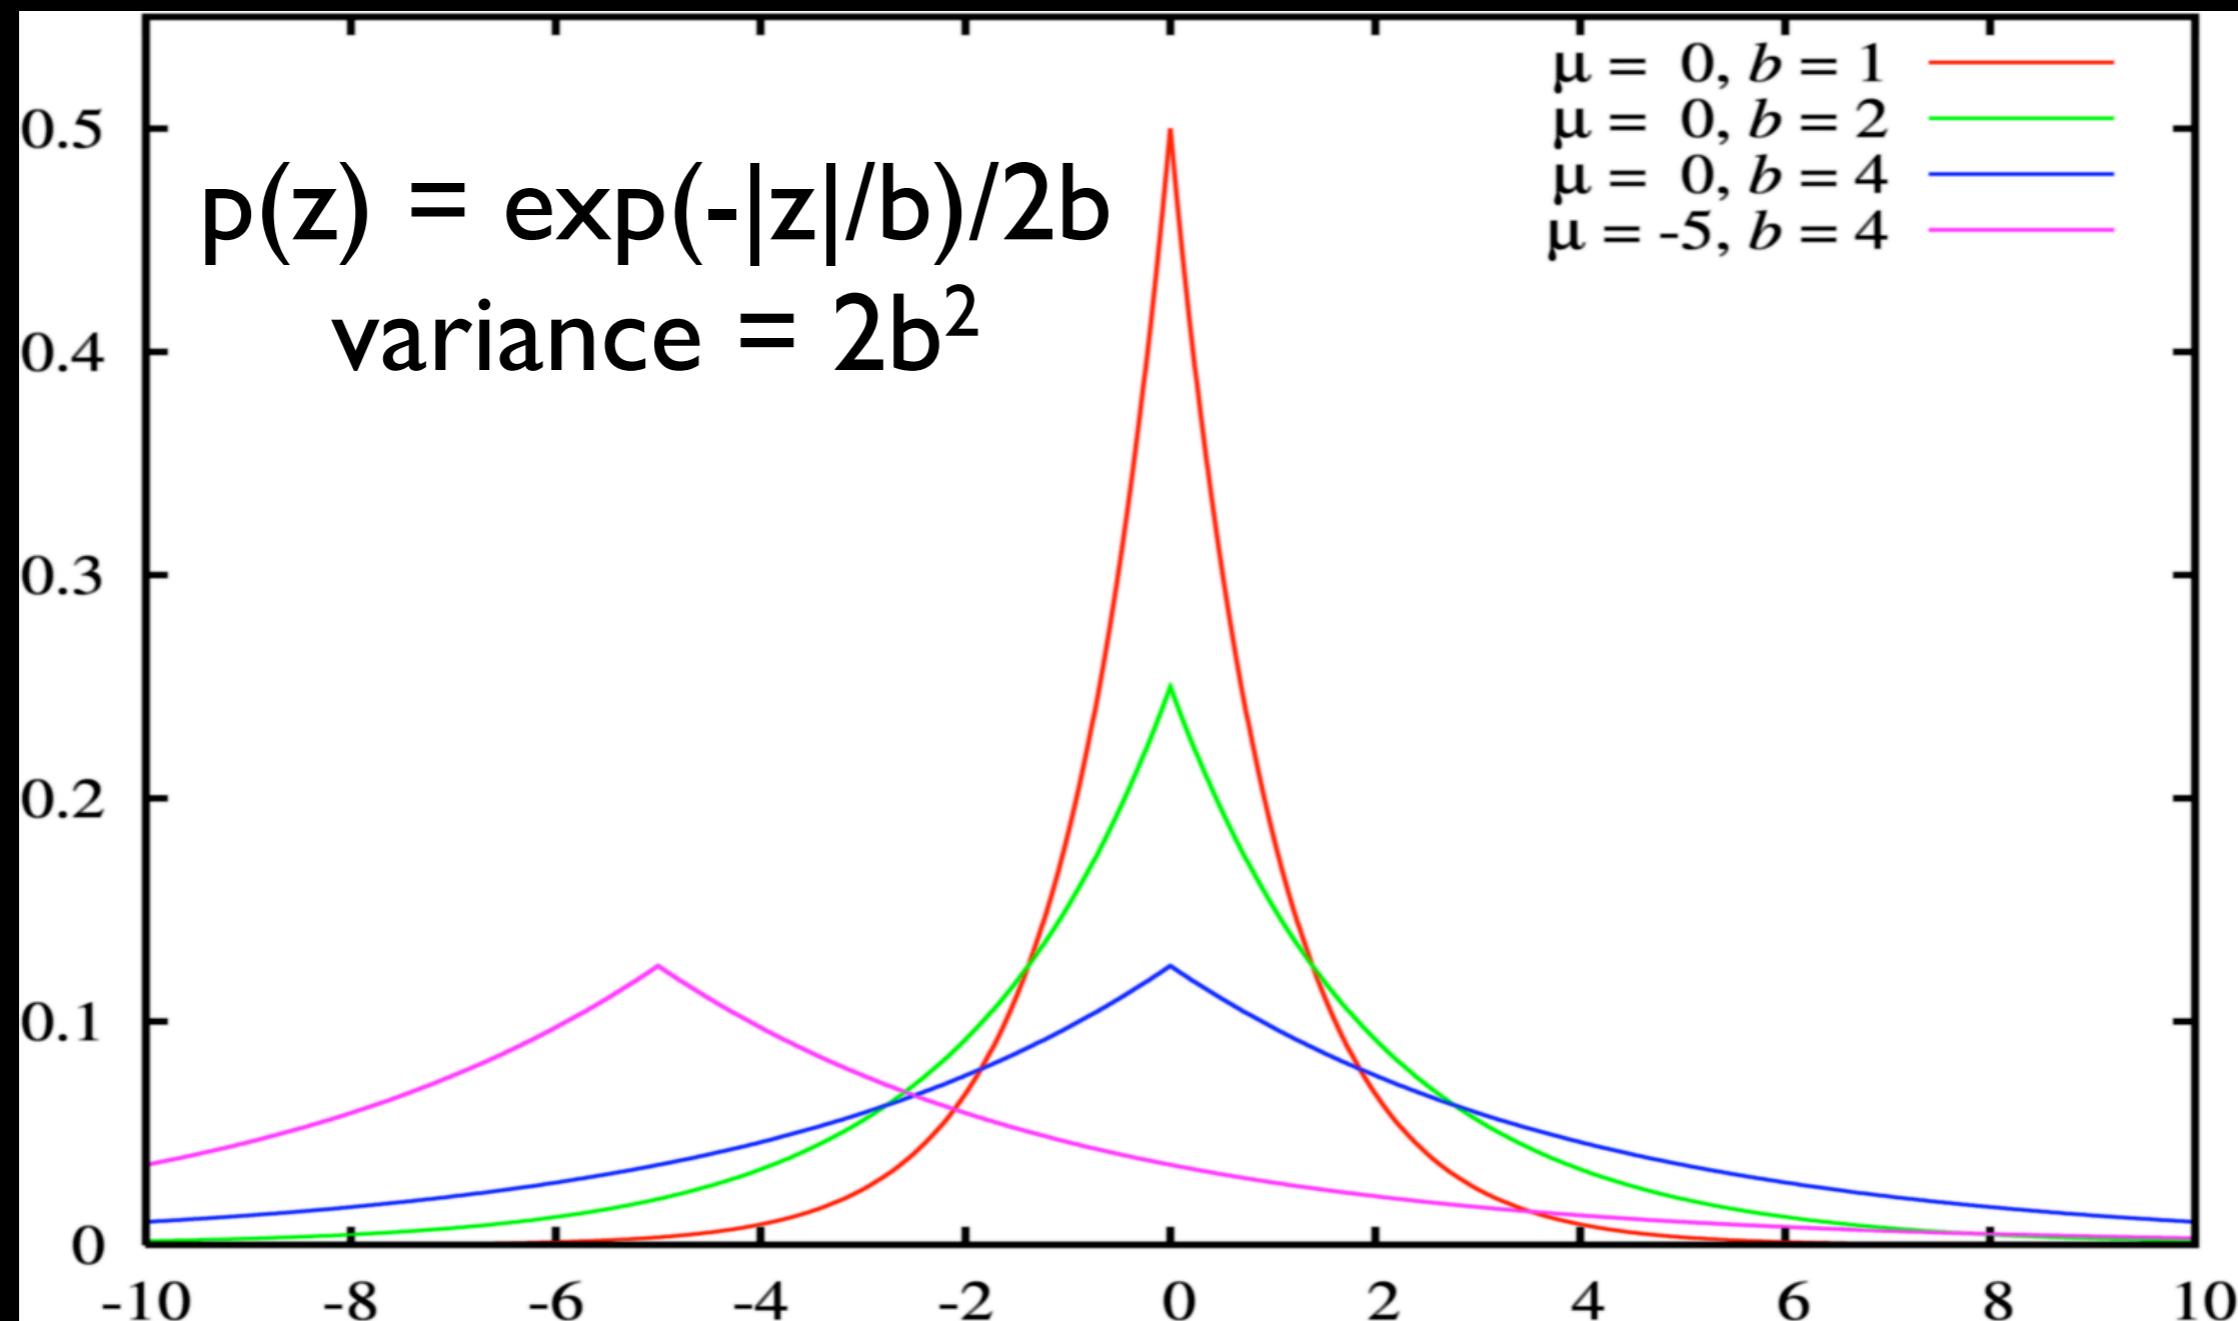

- measures how much one person can affect output
- sensitivity is 1 for **counting queries** that count number of rows satisfying a predicate

scale noise with sensitivity

$$\Delta f = \max_{D_1, D_2} |f(D_1) - f(D_2)|$$

[DMNS06]: on query f , can add scaled symmetric noise $\text{Lap}(b)$ with $b = \Delta f/\epsilon$, to achieve ϵ -differential privacy.

Laplace distribution Lap(b)

applying the Laplace mechanism

applying the Laplace mechanism

single **counting query**: how many people in the database satisfy predicate P ?

- sensitivity = 1
- can add noise $\text{Lap}(1/\epsilon)$

what if want more than one query? ...composition

- an ϵ_1 -DP mechanism, followed by an ϵ_2 -DP mechanism, is $(\epsilon_1 + \epsilon_2)$ -DP

what if want more than one query? ...composition

- an ϵ_1 -DP mechanism, followed by an ϵ_2 -DP mechanism, is $(\epsilon_1 + \epsilon_2)$ -DP
- can also sum both the epsilons and the deltas for (ϵ, δ) -DP

what if want more than one query? ...composition

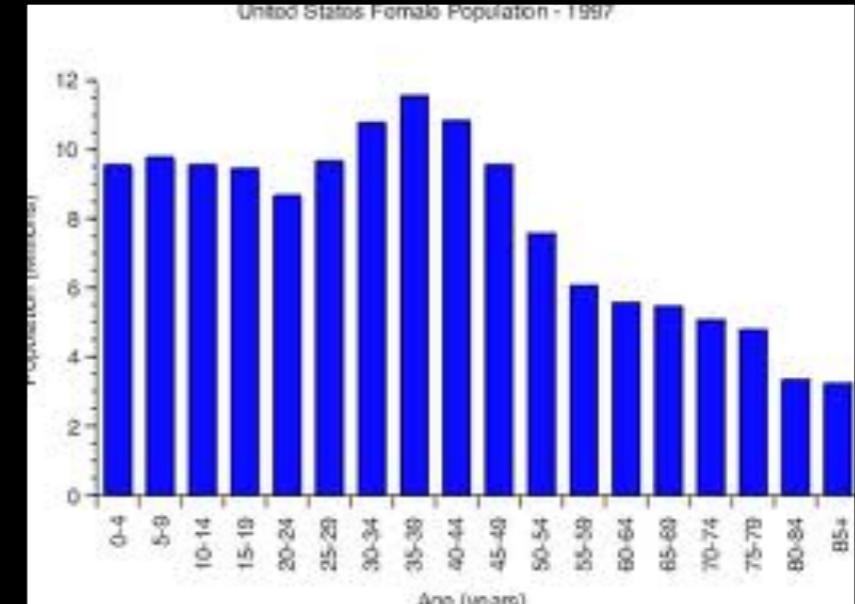

- an ϵ_1 -DP mechanism, followed by an ϵ_2 -DP mechanism, is $(\epsilon_1 + \epsilon_2)$ -DP
- can also sum both the epsilons and the deltas for (ϵ, δ) -DP
- more sophisticated argument: k runs of (ϵ, δ) -DP mechanisms gives $(\epsilon', k\delta + \delta')$ -DP for $\epsilon' = (2 k \ln(1/\delta'))^{1/2}\epsilon + k \epsilon (e^\epsilon - 1)$

applying the Laplace mechanism

vector-valued queries of dimension d

- can apply composition and add noise $\text{Lap}(d\Delta f/\epsilon)$ in each component of output, where Δf is the sensitivity of each component

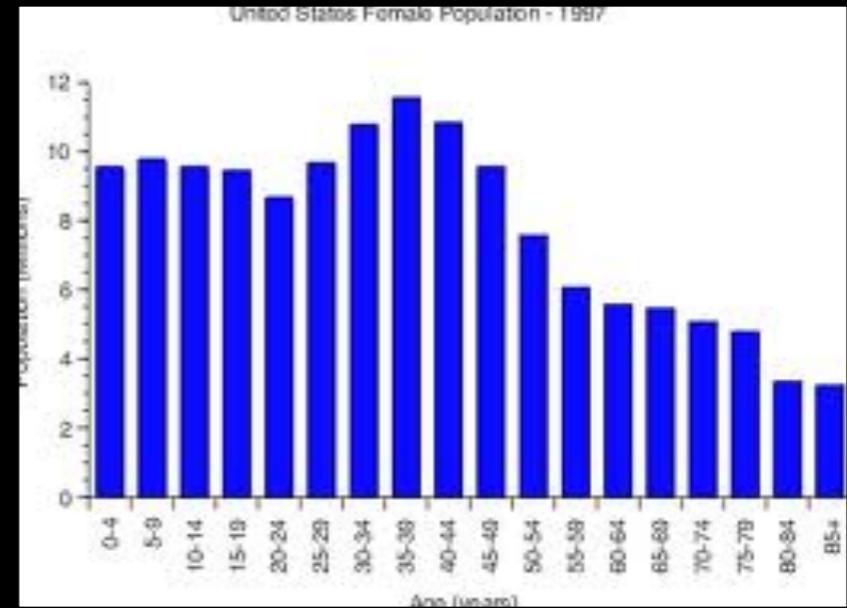

applying the Laplace mechanism

histogram queries

- could again use noise $\text{Lap}(d/\epsilon)$

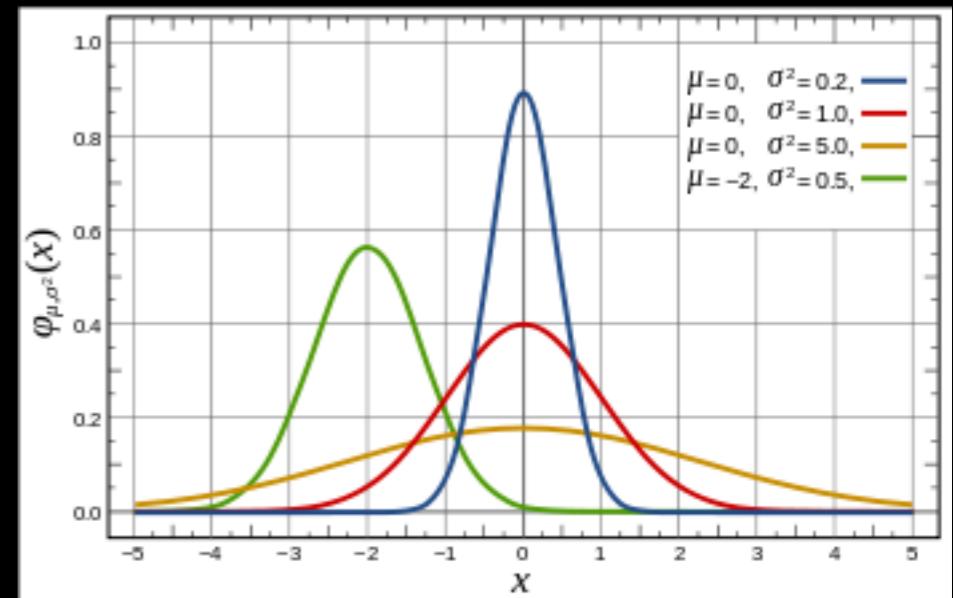

applying the Laplace mechanism

histogram queries

- could again use noise $\text{Lap}(d/\epsilon)$
- but actually only need $\sim \text{Lap}(l/\epsilon)$, since sensitivity generalizes as max L_1 distance

Gaussian mechanism

[DKMMN06]: Gaussian noise gives (ε, δ) -DP with

$$\sigma \geq (2 \ln(2/\delta))^{1/2} / \varepsilon * (\text{max L}_2 \text{ distance})$$

Ok, but I wanted to use my database for more than a handful of statistics...

Ok, but I wanted to use my database for more than a handful of statistics...

Data can be “big” in two dimensions: more rows makes privacy easier (lower sensitivity); more columns makes it harder (more queries to preserve)

handling an exponential number of queries

name	DOB	sex	weight	smoker	lung cancer

DNRRV09: (ϵ, δ) -DP, error $|Q|^{\circ(1)} n^{1/2}$

DRV10: (ϵ, δ) -DP, error $\text{polylog } |Q| n^{1/2}$

HR10: (ϵ, δ) -DP, error $\log|Q| n^{1/2}$

HLM12: simple & matches best bounds

a brief history of synthetic data (theory)

BLR08: ϵ -DP, error $\log^{1/3} |Q| n^{2/3}$

DNRRV09: (ϵ, δ) -DP, error $|Q|^{\circ(1)} n^{1/2}$

DRV10: (ϵ, δ) -DP, error $\text{polylog } |Q| n^{1/2}$

HR10: (ϵ, δ) -DP, error $\log|Q| n^{1/2}$

HLM12: simple & matches best bounds

a brief history of synthetic data (theory)

BLR08: ϵ -DP, error $\log^{1/3} |Q| n^{2/3}$

DNRRV09: (ϵ, δ) -DP, error $|Q|^{\circ(1)} n^{1/2}$

DRV10: (ϵ, δ) -DP, error $\text{polylog } |Q| n^{1/2}$

HR10: (ϵ, δ) -DP, error $\log|Q| n^{1/2}$

HLM12: simple & matches best bounds

Can (sometimes) do much better than naive noise addition, with much more sophisticated techniques

exponential mechanism [MT07]

select an element $C \in \text{range}(M)$ with
probability $\sim \exp(\epsilon u(D, C)/(2 \Delta u))$
where u is a “scoring function”

exponential mechanism [MT07]

select an element $C \in \text{range}(M)$ with

probability $\sim \exp(\epsilon u(D, C)/(2 \Delta u))$

where u is a “scoring function”

privacy obvious

exponential mechanism [MT07]

select an element $C \in \text{range}(M)$ with

probability $\sim \exp(\epsilon u(D, C)/(2 \Delta u))$

where u is a “scoring function”

privacy obvious

utility... depends

[BLR08]

combines

- **exponential mechanism** [MT07] for sampling complex output space
- sample complexity bounds from learning theory to guarantee existence of good output

[HLM12]

- simple to describe and to implement
- actually implemented and tested it
- state of the art in theory, performs well in practice (and quickly, despite bad worst-case news)

[HLM12]

- simple to describe and to implement
- actually implemented and tested it
- state of the art in theory, performs well in practice (and quickly, despite bad worst-case news)

...will hear more about multiplicative weights-based techniques in Jon's talk

I have to know all my queries in advance?!

interactive mechanisms

- so far, have discussed creating synthetic data where must know query set in advance
- tools exist to answer similar number of queries on the fly (correlating randomness across queries)

It seems like DP would add too much noise for my application.

It seems like DP would add too much noise for my application.

... stop and think about what this means

DP connected to *robustness* of computation to presence or absence of individuals

DP connected to *robustness* of computation to presence or absence of individuals

- computation not robust? (should worry!)

DP connected to *robustness* of computation to presence or absence of individuals

- computation not robust? (should worry!)
- need more data (individuals) to get desired privacy-utility tradeoff (should think)

DP connected to *robustness* of computation to presence or absence of individuals

- computation not robust? (should worry!)
- need more data (individuals) to get desired privacy-utility tradeoff (should think)
- expect on “real” data will be robust (we can do something about this!)

robustness (an aside)

- robustness in DP sense not identical to statistical robustness---DP is worst-case rather than wrt to distribution
- there are connections (will mention shortly)

expect study robust on actual
data

- idea 1: bootstrapping

bootstrap aggregation

- given training dataset, create many new training sets of smaller size by sampling uniformly with replacement
- fit your model (estimate your statistic) on each
- combine (e.g., voting, averaging)

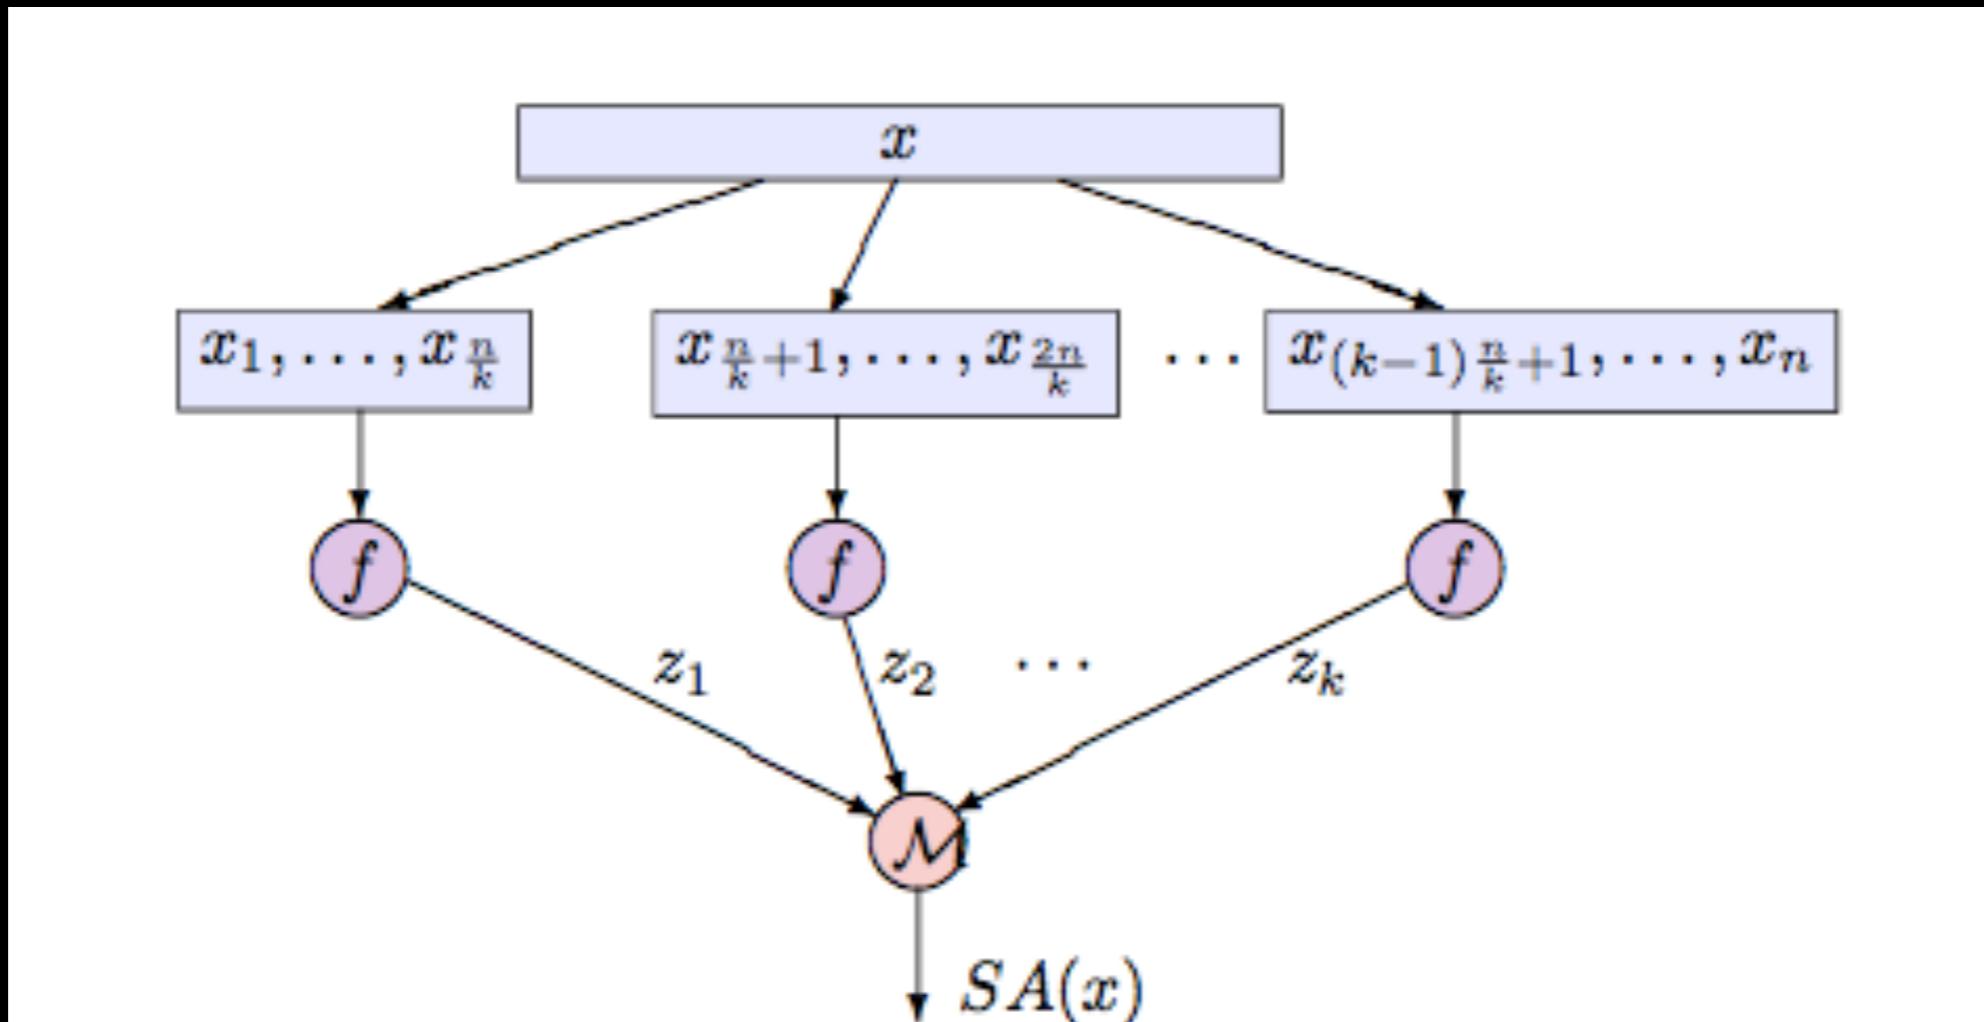

bootstrap intuition

- a “robust” statistic should be stable on most reasonably sized subsets of the data
- if statistic is somewhat unstable, aggregation “smooths” result
- if statistic was very stable, loss in precision should be small

bootstrap for privacy

- if function is not low-sensitivity but suspect it's usually stable, not clear how to guarantee DP
- if *aggregation* preserves privacy, get DP guarantee even when aggregating non-DP estimates

bootstrap for privacy =
subsample and aggregate [NRS07]

subsample and aggregate: good news

- can use any DP aggregation function (as long as choice doesn't depend on data)
- private aggregation just requires adding noise scaled to sensitivity of the aggregation function
- privacy is immediate!

subsample and aggregate: bad news

- may be difficult to bound worst-case sensitivity of aggregation function
- default bound is max of its range (quite bad)
- may be difficult to get good utility guarantees

subsample and aggregate: applications

- underlying function might be selecting best model from among set of m options; could aggregate with a noisy max

subsample and aggregate: applications

- underlying function might be selecting best model from among set of m options; could aggregate with a noisy max
- similarly, could output a set of significant features (as for LASSO)

expect study robust on actual
data

- idea 1: bootstrapping
- idea 2: check robustness before proceeding

check robustness

- would like to be able to test in DP manner whether computation “should” proceed
- “should”: e.g., whether desired function is robust (low-sensitivity) on *actual data*
- if not, halt

local sensitivity of function f on database D

$$\max_{D'} |f(D) - f(D')|_1$$

for D' neighboring data set of D

local sensitivity of function f on database D

$$\max_{D'} |f(D) - f(D')|_1$$

for D' neighboring data set of D

- measures how much one person can affect output on *this data*

propose-test-release [DL09]

- propose a bound on local sensitivity

propose-test-release [DL09]

- propose a bound on local sensitivity
- test in DP manner whether actual data satisfies bound

propose-test-release [DL09]

- propose a bound on local sensitivity
- test in DP manner whether actual data satisfies bound
- if fails, halt

propose-test-release [DL09]

- propose a bound on local sensitivity
- test in DP manner whether actual data satisfies bound
- if fails, halt
- if passes, release function with noise tailored to *local sensitivity*

notes on propose-test-release

- *test* could be “what is L_1 distance to closest database that fails local sensitivity bound?”

notes on propose-test-release

- *test* could be “what is L_1 distance to closest database that fails local sensitivity bound?”
- test only has sensitivity 1

notes on propose-test-release

- *test* could be “what is L_1 distance to closest database that fails local sensitivity bound?”
- test only has sensitivity Δ
- can use conservative local sensitivity threshold

notes on propose-test-release

- test could be “what is L_1 distance to closest database that fails local sensitivity bound?”
- test only has sensitivity 1
- can use conservative local sensitivity threshold
- could still sometimes fail; can’t get ϵ -DP

DP output need not be noisy!

DP output need not be noisy!

PTR can be used to privately check whether distance to nearest unstable data set is far, and if so release the *true* $f(x)$

robustness, revisited

robustness, revisited

- robustness wrt adding/removing a few points from dataset

robustness, revisited

- robustness wrt adding/removing a few points from dataset
- robustness wrt subsampling

subsample & aggregate + propose-test-release

[ST13]: can modify subsample & aggregate so
that outputs true $f(x)$ with high probability
when f is subsampling stable on x

subsample & aggregate + propose-test-release

[ST13]: can modify subsample & aggregate so
that outputs true $f(x)$ with high probability
when f is subsampling stable on x

shows that DP model selection only increases
sample complexity of model selection by
 $O(\log(l/\delta)/\epsilon)$

DP statistics

DP statistics

- connections to robustness; interquartile distance, median, linear regression [DworkLei09]

DP statistics

- connections to robustness; interquartile distance, median, linear regression [DworkLei09]
- M-estimators [Lei11, NekipelovYakovlev11]

DP statistics

- connections to robustness; interquartile distance, median, linear regression [DworkLei09]
- M-estimators [Lei11, NekipelovYakovlev11]
- for almost any estimator that is asymptotically normal on i.i.d. samples, DP adds asymptotically no additional perturbation [Smith11]

DP statistics

- connections to robustness; interquartile distance, median, linear regression [DworkLei09]
- M-estimators [Lei11, NekipelovYakovlev11]
- for almost any estimator that is asymptotically normal on i.i.d. samples, DP adds asymptotically no additional perturbation [Smith11]
- convergence rate of DP estimators tied to gross error sensitivity [ChaudhuriHsu12]

I need to look at the data before I know what statistics to run.

I need to look at the data before I know what statistics to run.

not DP

I need to look at the data before I know what statistics to run.

not DP

interactive (or hybrid interactive/
noninteractive) mechanisms?

I need to look at the data before I know what statistics to run.

not DP

interactive (or hybrid interactive/
noninteractive) mechanisms?

big data force us to formalize “looking at the
data”

summary

summary

- privacy easy to get wrong; DP provides compelling definition and useful dose of paranoia

summary

- privacy easy to get wrong; DP provides compelling definition and useful dose of paranoia
- powerful tools exist (some with no cost of privacy, and some with no noise!)

summary

- privacy easy to get wrong; DP provides compelling definition and useful dose of paranoia
- powerful tools exist (some with no cost of privacy, and some with no noise!)
- powerful intuition from notions of robustness

summary

- privacy easy to get wrong; DP provides compelling definition and useful dose of paranoia
- powerful tools exist (some with no cost of privacy, and some with no noise!)
- powerful intuition from notions of robustness
- many nearly ready (and quite relevant) to common big data applications
